Where it lives [1, 2]

Dots are approximate regional centres, not exact sightings.
Historical reports; no complete or current range boundary implied.

TROPICAL FRESHWATER

Forest waterways

Slow rivers, lakes, swamps and flooded forests; blackwater streams can be stained brown by tannins from plant material. [1]

Reported across parts of mainland Southeast Asia, the Malay Peninsula, Sumatra and Borneo. The map selects four named regions from the USFWS account; it does not mark whole countries as occupied habitat. [1, 2]

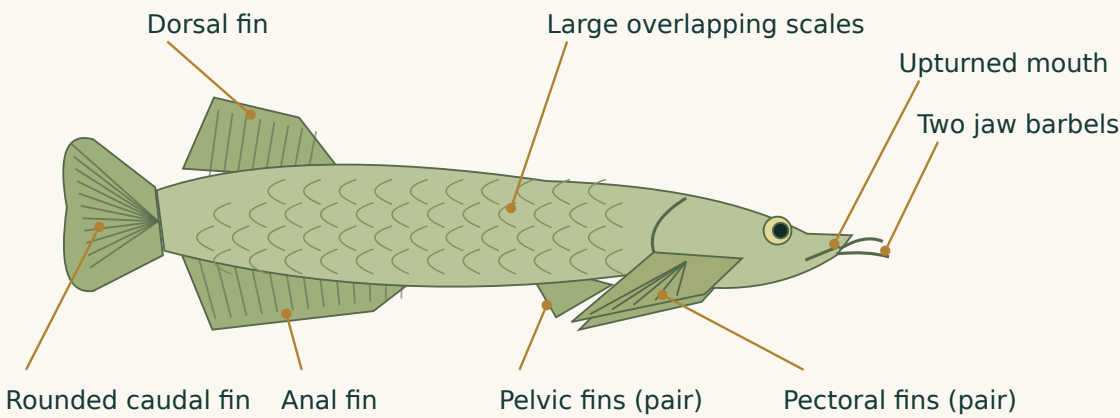

Life near the surface

Juveniles eat insects at the surface. Larger fish also take fish and small vertebrates. [1, 2]

ENDANGERED • IUCN 2019

Habitat loss and collection pressure threaten wild populations. Captive fish and release records should not be mistaken for native populations. [3]

Built like a dragon [2]

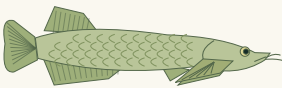

The head, upturned jaw and plate-like scales in close view. Maximum reported length: **90 cm total length**, including the tail. [1]

Swimming study

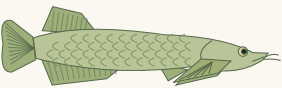

Proposed game motion • not measured arowana kinematics

DRIVE

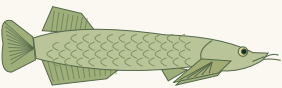

Tail drive → forward swim

COAST

Reduced beat → glide

TURN / BRAKE

Arc turn; pectoral braking

A father's nursery

The male carries eggs and larvae in his mouth while the young develop. [2]

Dragon fish: associated with luck and prosperity; colour forms have a long ornamental-trade history. [2]

Singapore reservoir records include introduced fish, rather than proof of a native range there. [4]
