

Blue Jelly & Blue Dream

Neocaridina davidi · two blue colour morphs, one planted tank · anatomy and animation study

Blue Jelly · Blender 5 / Cycles
Shared model; shell 0.28, legs/antennae 0.18; opaque eyes.

Blue Jelly · In-game / Chromecast HD
Tank capture crop; scenery remains visible through the shell.

Blue Dream · Blender 5 / Cycles
Original palette materials and geometry; opacity 1.0.

Blue Dream · In-game / Chromecast HD
Tank capture crop; original saturated blue appearance retained.

Built for grazing and swimming. Walking legs and abdominal swimming limbs are separate groups. The first two walking-leg pairs help handle food. [1] The current game rig groups these features into five mesh parts.

Behaviour to suggest. These shrimp spend much of their time grazing on biofilms. [1] Resting, crawling and brief swimming excursions are the game's authored motion states; tail-flick timing is a tunable.

Running game colony: 24 total, 12 of each morph; the player is included. Both varieties use the sand, rock and wood routes. Actual Chromecast capture. Close-ups above are crops of this view; Blender uses a studio backdrop.

BIOLOGY · SOURCED

Small freshwater grazers

This species originates from Taiwan; selective breeding produced the ornamental colour morphs. Adults can reach 3–4 cm. [1]

The clear silhouette should retain dark eyes, antennae and a segmented abdomen. Internal markings in the Jelly drawing are restrained visual cues, not a complete anatomical reconstruction.

GAME · PROPOSED ART SETTINGS

One rig, two appearances

- Five parts: body, tail, near legs, far legs, antennae.
- Current body opacity: Jelly 0.28; original Dream 1.0. These are artistic choices, not measured biology.
- Eyes stay opaque; Jelly legs and antennae use opacity 0.18.
- Same exported triangle geometry and five-part rig for both varieties.
- Keep the existing routes and controls. Shared engine support sorts and blends translucent faces.
